| <u>LF Study Notes</u> | | | |
|-----------------------|--|------------------------------|------------|
| • | A <u>hazard</u> is a situation (<i>crushing</i>) or thing (<i>outrigger</i>) that has potential to cause harm. | | |
| • | A <u>risk</u> is the chance death or injury may occur from a hazard. | | |
| • | You have a duty of care to protect yourself and others from harm. | | |
| • | If you work unsafely your licence will be suspended or cancelled. | | |
| • | Some workplace safety information can be found from the | | |
| | 0 | Safe work method statemen | t S |
| | 0 | A ustralian Standards | A |
| | 0 | Code of practice | С |
| • | An employer must provide | | |
| | 0 | Safe systems of work | (SAFE) |
| | 0 | Safe plant & structures | |
| | 0 | Safe work environment | |
| • | When you are unfamiliar with the crane you are going to sit in & operate your | | |
| | employer must provide you with adequate | | |
| | 0 | S upervision | S |
| | 0 | Instruction | 1 |
| | 0 | T raining | Т |
| • | You need to consult with others about hazards for example | | |
| | 0 | S afety officer | S |
| | 0 | Other workers | 0 |
| | 0 | S upervisors | S |
| | You need to consult about site specific hazards, policies and procedures. | | |
| | Common hazards: | | |

- - Looking Up are powerlines, weather, buildings. 0
 - In line of sight are plant, vehicles & pedestrians. 0
 - Looking Down & below are underground services, uneven ground, trenches.

- Planning considerations are:
 - PermitsP
 - o Location L
 - Access
 - CommunicationsC
 - o Equipment E
- PPE & communications must be inspected before use.
- Hazard controls need to be in place before work and as they arise.
- Safe minimum distance from power lines for QLD <u>3m, 6m, 8m</u>. To work closer than that you need to <u>isolate or insulate</u>.
- Find out voltage contact electrical authority.
- Tiger tails & marker balls are some visual aids to highlight powerlines.
- If you hit powerlines you must stop, break contact, alert all, do not touch others receiving a shock, isolate crane if safe to do so, report.
- For safety of pedestrians, workers, vehicles or plant you can use traffic controller,
 barricades & signage.
- Adequate lighting must be provided at night.
- It's dangerous to use internal combustion engine in confined spaces <u>People could be</u> overcome by dangerous gasses. Electric forklifts should be used for this work.
- Ensure to check weather forecasts to prepare & plan to control risks.
- You need to charge batteries in well-ventilated area as <u>batteries give of explosive</u>
 gasses & need to be vented to avoid explosion.
- If operating forklift on wet or slippery surfaces <u>reduce speed, avoid ramps or inclined</u> <u>pathways.</u>
- Rear end swing is dangerous when using forklift <u>creates a risk for personnel</u>,
 <u>structures</u>, <u>plant or equipment close by because of fast sideways movement of forklift</u>.
- It's dangerous to refuel with engine running <u>fuel could ignite</u>.
- Some ways to communicate with people in workplace are <u>written instruction</u>, <u>signage</u>,
 questioning & listening to confirm understanding.
- If a signal is given from a co-worker which is unclear ensure to stop & clarify before proceeding.

- In an emergency you must communicate <u>W</u>hat & <u>W</u>here the emergency is & <u>W</u>ho is involved. (WWW) Alert personnel & emergency services.
- Pre start checks can include: Fluids, Fuel, Tyres, Data plates, Attachments, All guards.
- Some start-up checks before operation <u>Brakes</u>, <u>Hydraulics</u>, <u>Warning devices</u>.
- Pre-start checks you find damage or defects, data plate, load charts missing or damaged or after starting you notice defects <u>S</u>top, <u>Tag</u>, <u>I</u>solate, <u>R</u>ecord, <u>R</u>eport (STIRR).
- Hazards created by weather Strong wind, Ice, Poor vision
- Rated capacity is the maximum load the forklift can carry at a load height & specific load centre distance shown on chart.
- It's important correct operating tyre pressure maintained to assist in maintaining stability of forklift.
- It's important to check condition of tyres & wheels for <u>no large pieces of rubber</u> missing, tyres not worn down, security of wheels.
- Types of guards & there function <u>Load bracket stops load mast & protects operator</u>,
 Overhead guard protects operator from falling objects.
- Find out weights of loads <u>Delivery docket</u>, <u>Marked on it</u>, <u>Calculate</u> (DMC).
- Operator can make minor repairs to forklift only if competent & authorised to do so.
- If view is obstructed before moving <u>Check pathway is clear, look over both shoulders</u>,
 use warning devices horns & flashing lights
- You must watch the load movement to ensure safety of personnel, load & structural stability.
- When driving a loaded forklift uphill the load should <u>face the load and forks up the</u>
 <u>ramp.</u>
- When driving a loaded forklift uphill it's unsafe to turn you could lose the load or you
 could tip the forklift.
- Do not lift over others as it could cause death or injury.
- Forklift can only carry passengers <u>if it's specifically designed & equipped to carry more</u>
 than 1 person

- it's riskier operate forklift with load raised as <u>load height can affect stability while</u>
 moving creates there is a possibility of tip or roll over or loss of load. Safe height when driving forklift is <u>at axel height or as low to surface as practical.</u>
- it's unsafe to carry load on 1 fork <u>stability of forklift can be affected, can over stress</u> fork resulting in damage or failure.
- Some actions that could tip forklift over sideways when traveling <u>turning at unsafe</u>
 <u>speed, uneven surfaces, unevenly distributed load, flat or under-inflated tyres, driving</u>
 to fast.
- Some actions that could tip forklift forward or backward while traveling <u>driving over</u> uneven surfaces, unevenly distributed load, driving to fast, overloading, severe <u>braking.</u>
- If forklift tips over sideways <u>remain in forklift</u>, <u>brace yourself until forklift is stationary</u>
 & is safe to exit.
- Wearing a seatbelt is important <u>stops operator falling out in event of tip over, stops</u>
 operator from being propelled into structure or out of forklift in collision.
- Point of balance on forklift is <u>where the front tyre touches the ground.</u> All weight behind that acts as the counterweight. You are not allowed to add counterweights
- Side-shift must be centred before traveling <u>To maintain stability of forklift & load.</u>
- Stacking loads on top of each other <u>stack on firm level surface</u>, <u>heavy goods on</u>
 <u>bottom</u>, <u>stack must not be unstable due to height</u>. If a pallet appears unsafe <u>safely</u>
 <u>repack load</u> before moving.
- In gap between truck & loading dock <u>Secure dock plates or bridge plates</u> must be fitted before shifting load.
- During emergencies you must give way to <u>all emergency vehicles.</u>
- Load centre distance means <u>distance from vertical face of fork to COG of load.</u>
- If load isn't hard against heel of fork forklift's capacity is reduced & stability affected.
- Some places you should not park forklift on slopes, emergency exits, near doorways.
- Normal steps for parking forklift <u>fork arm lowered tip to ground, forklift in neutral,</u>
 <u>park brake applied, workplace-specific procedures.</u> If you had to park on slop <u>in</u>

 addition to normal procedure, chock wheels
- Remove key from forklift when unattended. To prevent unauthorised use
